Preface

This issue of the edition of the journal *Contributions* consists of papers of authors inspired by the fact that this is a pioneer attempt for publishing in English and the promotion of the research results and achievements among the biggest auditoria. It was a response of the most brave and those who watch and perceive the space of the scientific and teaching improvement only through science.

The papers presented in the journal represent different scientific aspects, which confirm the ideas and efforts of the publisher for multidisciplinary of the journal. The seven papers published in this number of the journal *Contributions* present the first seven steps made by the Macedonian Science Society - Bitola for internationalization of the journal and creation of an extra value in the scientific and vocational societies in the country and abroad.

By the processes of reviewing and selection of the papers we have come to the small number of papers in this edition, which presents the effort of the publisher for promotion of the quality.

The current edition of *Contributions* opens doors, calls and encourages the host and the authors from abroad to publish a piece of their scientific potential with *Contributions*.

Bitola, 15.11.2018

Dean Iliev PhD., Full professor

Предговор

Овој број на списанието *Прилози* содржи трудови од автори кои беа инспирирани од фактот што ова претставува пионерски обид за објавување на списанието на англиски јазик од една страна, но и промоција на истражувачките резултати и постигнувања на критика на поголем аудиториум. На провокацијата за објавување трудови на англиски јазик одговорија најхрабрите и оние кои просторот за наставно и научно напредување го гледаат единствено преку науката.

Во овој број се објавуваат трудови од различни научни подрачја, полиња и области со што се потврдува мултидисциплинарноста на списанието.

Седумте трудови на англиски јазик сместени во овој број се првите седум чекори кои ги прави Македонското научно друштво - Битола во насока на интернационализација на списанието и создавање негова дополнителна вредност во научните и стручните кругови во земјава и странство.

Преку рецензија на трудовите и нивна селекција дојдовме до скроман број на трудови во списанието, што е израз на желбата и намерата на издавачот за истакнување и промоција на квалитет.

Овој број на списанието отвора порти, повикува и охрабрува домашни и автори од странство да објават парче од својот научен потенцијал преку списанието *Прилози*.

SOCIAL CORRELATES AS A RISK FACTORS FOR VIOLENCE AMONG INDIVIDUALS WITH MENTAL DISORDERS

Abstract

Violent behavior occurs in a social system that includes a person who has a certain life history, a certain state of health or a disorder and interaction with certain social circumstances. Biological and environmental interaction is responsible for violence and aggression. Theories of social teachings indicate that violent behavior is a product of former experiences, which include predisposing environmental conditions. Permanent displays of violence in the media are desetting the viewer of violence. The aim of the paper was to determine the impact of risk factors of a social nature, which determine the violent behavior among people with mental disorders. The study is prospective with a retrospective approach. The research was conducted at the Psychiatric Hospital Demir Hisar, Psychiatric Hospital "Skopje" - Skopje and the Center for Mental Health Prilep. The time frame for the research was between May 2014 and May 2015. For the needs of the research, a conducted interview was created for assessing the social / demographic characteristics, as well as obtaining data related to the crime, that is, the type of violence. The interview with patients was consisted of 7 questions. The investigation showed following results: the dominant age is 32 years in the group of perpetrators of violence, 46 % of the respondent are unemployed, 73 % of them from the urban environment, 46% with high school, 36 % of them married. The most dominant diagnosis is schizophrenia and schizophrenic disorders with around 50 %, in the 56% of the respondents the noted criminal act had been the first one.

Key words: *mental disorder, violence, social factors*

Introduction

The myth that the mental disorder in its very nature means the manifestation of violence persists for centuries with a trend of intensifying of these convictions, despite the fact that in the last decades, many campaigns have been made to reduce fear in the public. There are still no definite answers to the questions how much the

manifestation of violent behavior correlates with the very nature of mental disorders under different circumstances or is it associated with other developmental and life historical variables. Violent behavior occurs in a social system that includes a person who has a certain life history, a certain state of health or a disorder and interaction with certain social circumstances. Biological and environmental interaction is responsible for violence and aggression. It is therefore necessary to pay attention to the psychosocial factors that contribute to the development of violent behavior. Theories of social teachings indicate that violent behavior is a product of former experiences, which include predisposing environmental conditions. Permanent displays of violence in the media are desetting the viewer of violence. (Griffith et al., 2014) Swanson and his colleagues identify numerous environmental factors that are significantly related to violence, including homelessness and testimony or experience of violence. (Swanson et al., 2002)

2. Objective

The aim of the paper was to determine the impact of risk factors of a social nature, which determine the violent behavior among people with mental disorders.

3. Methods and materials

The study is prospective with a retrospective approach. The research was conducted at the Psychiatric Hospital Demir Hisar, Psychiatric Hospital "Skopje" - Skopje and the Center for Mental Health Prilep. The time frame for the research was between May 2014 and May 2015. The investigated group consisted of 89 patients admitted to the Psychiatric Hospital Demir Hisar, most of them patients in the forensic psychiatric department and the forensic psychiatric department at the Psychiatric Hospital "Skopje" Skopje. These are patients who have committed a crime and have a diagnosis of psychiatric disorder according to ICD 10. Based on that diagnosis, a safety measure has been established "keeping and treatment in a psychiatric institution." The research excludes the individuals who are admitted to the court psychiatric departments with diagnosis F 11 "Narcotic Dependency. After obtaining consent for participating in the research, patients were interviewed and the envisaged questionnaires were used. Respondents from the investigated group are marked as perpetrators of the criminal act- (PCA). The control group consists of 120 patients, some of them are beneficiaries of the Center for Mental Health Prilep, and some patients in the Psychiatric Hospital Demir Hisar, who are not perpetrators of the crime. The control group is divided into two subgroups. One subgroup consists of 60 patients who did not manifest violence in their history of illness. This group is designated as a control group without violence CG WV. The other nurse consists of 60 patients at the PHI Psychiatric Hospital Demir Hisar who were forcibly hospitalized from May 2008 to June 2010 and who according to sex and diagnosis responded to the conditions of the research. This subgroup is a control group for forced hospitalization CG FH. the research, besides the measuring instruments, data from the clinical psychiatric interview with the patients themselves, medical histories, psychological findings and judicial psychiatric expertise were used. For the needs of the research, a conducted interview was created for assessing the social / demographic characteristics, as well as obtaining

data related to the crime, that is, the type of violence. The interview with patients was consisted of 6 questions. In addition to the interview, in order to obtain comprehensive data related to this sphere, medical histories and forensic psychiatric expertise were also used.

In the methodology of the research, it is important to note that a whole forensic population is located on the forensic departments in the two psychiatric hospitals in the Republic of Macedonia.

Results

According to the sex, 89 patients in the examined group are significantly dominated by the male sex, 88 are men and 1 was a women.

Regarding the **age representation**, the perpetrators of the crime with 32 (35.9%) are dominated by patients aged 31 to 40 years.(table 1).

Table 1. Age of respondents

Age			CG WV		CG FH	
	N	%	N	%	N	%
20-30	14	15.73	7	11.67	8	13.33
31-40	32	35.96	18	30.0	14	23.33
41-50	22	24.72	15	25.0	11	18.33

> 70	2	2.25	0	0	0	0
Total	89	100	60	100	60	100

Regarding of the work engagement, the unemployed are the largest group among the respondents who committed the criminal act - 41 (46.1%), followed by the workers with 24 (26.97%) respondents, and only 8 (9%) of the patients with violent behavior are pensioners. The highest number of respondents without violence is 39 (65%), the same number of respondents in this group are employees and employees (7.7%), while at least 5 (8.3%) patients in this group are pensioners.

Table 2. Work engagement

Work engagement	PV		CG WV		CG FH	
	N	%	N	%	N	%

Unemployed	41	46.07	39	65.0	31	51.67

Farmer	11	12.36	2	3.33	8	13.33
Officer	5	5.62	7	11.67	4	6.67
Retiree	8	8.99	5	8.33	12	20.0
No occupation	0	0	0	0	0	0
Total	89	100	60	100	60	100

Regarding the origin of the respondents, 51 (57.3%) of the respondents in the crime group, 44 (73.3%) of the control group without a criminal offense, and 42 (70%) of the group with forced hospitalization originate from the urban environment, while 38 (42.7%) perpetrators of criminal acts, 16 (26.7%) cases with psychiatric disorder without violence, and 18 (30%) patients forcibly hospitalized from rural areas.

Regarding education, primary and secondary education are the most frequent categories of education among the examinees from all three analyzed groups, that is, about 80% of patients with mental disorders belonging to the analyzed groups have completed primary or secondary education. (table 4)

Table 3. Education of the respondent

Education	PV		CG WV		CG FH	
	N	%	N	%	N	%
Elementary	37	41.57	20	33.33	23	38.33

Regarding the history of criminal acts among the respondents, it is evident that in the group of perpetrators of criminal acts more than 50 per cent (59,55%) of them committed the crime first (table 6).

Table 6. The history of crime

Crime	PV	
	N	%
First crime	53	59,55
Recidive	36	40.45
No crime	0	0
Total	89	100

Discussion

A number of demographic variable is considered to be of interest in understanding any potential relationship between mental disorders and violent or criminal behaviour and among these is biological sex. In the general population, males are much more likely than females to engage in violent and criminal behavior (Bonta, Law, & Hanson, 1998). In communitybased epidemiological studies of self-reported violence and in studies of criminality among persons with mental disorder, male sex is a significant predictor of violent and criminal behavior (Buckley et al. 2003; Lovell, Gagliardi, & Peterson, 2002; Robbins, Monahan, & Silver, 2003).

Regarding poor engagement in educational and employment pursuits, which generally are prosocial activities, is a risk factor for criminal behavior. Having a serious mental illness is strongly linked with relatively low educational levels and under or unemployment (Draine, Salzer, Culhane, & Hadley, 2002). For example, in a study of over 500 patients with schizophrenia, (Mueser, Salyers & Mueser, 2001) found that only 10--21% of participants were competitively employed during a two year observation period. Problems with family and romantic partners are a weak, but relatively robust risk factor for criminal behavior in both adults (Derszon, 2010) and adolescents (Leschied, Chiodo, Nowicki, & Rodger, 2008). Family members are often primarily responsible for providing housing, financial support, and emotional support for people at risk for criminal behavior

(Naser&LaVigne,2006).Regarding of the origin of respondents results show that there is predominant number of respondents from both groups who live in an urban environment. It is explained by many studies that confirm that the effects of infrastructure (population density, accessto green space), economic issues (rates of employment, workingconditions), environmental pollutants (air pollution, noise, toxins,light) and social conditions (social coherence, density of socialnetworks) should be considered and weighted in order to identify the most potent contributors to social stress (Lederbogen et all. 2013; Fonken et all, 2011; Heim, C., Binder, E.B., 2012.)Low educational level is astrong markers for mental illness (Lund at all.2011; Patel et all.2010), but also rates of violence increased with lower education level. In theLS/CMI study (Skeem eal.,2008), parolees with mentalillness score dashigh (lower education, lowengagement in prosociale isurepursuits) or higher (employmentinstability; family and marital problems) than those without mental illness across the risk factors. Inpart, those with mental illness may suffer greater ([Rueve M](#), [Welton R.S](#), 2008; Stanton et all, 1997) Psychiatric disorders associated with violence are wide-ranging. A number of studies have found a relationship between mental disorder and criminality or violence (Sirotich,2008). It is important to note, however, that although these studies found an increased relative risk of criminality among persons with major mental disorders(MMD), the absolute risk of crime among persons with MMD is relatively modest.(Fazel & Grann, 2006; Corrigan& Watson, 2005; Stueve & Link, 1997). Although many studies suggest that people with schizophrenia are at increased risk of manifestation of violence (Mullen Paul E., 2006; Swanson et all, 2006)in our study the number of schizophrenic patients in examined group is lower compared to the control group. It is interesting to note that in this study in the experimental group there is substantial stepped on comorbidity with antisocial personality disorder and that combination is in a higher correlation with the manifestation of violence than schizophrenia symptoms on alone basis.The best predictor offuturebehaviorispast,likebehavior. For that reason, it is not surprising that a history of criminal behavior (particularlychronic, frequent, and with early onset) is one of the most robust predictors of criminal recidivism (Campbell, French,& Gendreau, 2009; Cottle, Lee & Heibrun, 2001; Gendreau, Little, & Goggin,1996; Mulder, Brand, Bullens,& Marle, 2011).

PERSONALITY TYPES OF PEOPLE WITH VERY SUPERIOR INTELLIGENCE

Abstract

This paper examines the personality types on a sample of 85 respondents with very superior intelligence (47 male, 38 female). Their average age is 25 years (the youngest is 15 and the oldest 52 years). The sample is obtained based upon the results of the Raven progressive matrices - advanced II. The quotients of intelligence obtained for this sample range from 148 (in 15.30 %) to 178 (in 1.18%). Most of the subjects in the sample (20.00%) are with a quotient of intelligence of 152. For determining the of personality types was applied the Myers-Briggs Type Indicator (MBTI form G) by Katherine Briggs & Isabel Briggs Myers. Based upon the responses of 126 items, the subjects were categorized into 16 personality types. This instrument provides information for four (4) sets of preferences: Extraversion (E), Introversion (I), Sensing (S), Intuitive (N), Thinking (T), Feeling (F), Judgmental (J), and Perceptive (P). Also, it provided findings of the dominant psychological functions between the sexes.

The results showed differences between participants of different sex in terms of preferences. In the first set of preferences (E-I), a bigger number of male preferred Extraversion E (53.19%), but the bigger number of female preferred Introversion (I) (57.90%). In the second set of preferences (S-N), the bigger number of male preferred Sensing (S) (59.57%), but a bigger number of female preferred Intuitive (N) (63.20%). In the third set of preferences (T-F), the majority of male (91.49%) and female (89.47%) preferred thinking (T), compared to feeling (F). In the fourth set of preferences (J-P) 70.21% of male preferred Judgment (J), however the number of female who prefer Judgment (J) (50 %) is equal to the number of women who prefer Perception (P) (50 %)

The findings regarding the dominant psychological functions show that: in the male prevails the combination of Sensing (S) with Thinking (T) (57.45 %), while in the female prevails Intuition (N) with Thinking (T) (52.62 %).

Key words: *personality types, very superior intelligence, psychological function*

Introduction

The goal of this research is to obtain empirical data and to check whether people with very superior intelligence are characterized by specific personality types. In addition, we intend to check whether individuals with very superior

¹ Associate Professor D-r Sasho Kochankovski, Faculty of Psychology, ISU "G.R.Derzavin", Sveti Nikole-Bitola, e-mail: kochankos@hotmail.com

intelligence are characterized with specific dominant functions of their personality type.

Sample and Instruments

This paper examines the personality types on a sample of 85 respondents with very superior intelligence (47 male, 38 female) from the Republic of Macedonia. Their average age is 25 years (the youngest is 15 and the oldest 52 years). The sample is obtained based upon the results of the Raven progressive matrices - advanced II. The quotients of intelligence obtained for this sample range from 148 (in 15.30 %) to 178 (in 1.18%). Most of the subjects in the sample (20.00%) are with a quotient of intelligence of 152. For determining the of personality types was applied the Myers-Briggs Type Indicator (MBTI form G) by Katherine Briggs & Isabel Briggs Myers. Based upon the responses of 126 items, the subjects were categorized into 16 personality types. This instrument provides information for four (4) sets of preferences: Extraversion (E), Introversion (I), Sensing (S), Intuitive (N), Thinking (T), Feeling (F), Judgmental (J), and Perceptive (P). Also, it provided findings of the dominant psychological functions between the sexes.

Results

Concerning the results obtained for the personality types the distribution of respondents according to the personality types presented in Table 1.

Table 1. Distribution of respondents (frequencies and percentages) according to the type of personality (N = 85)

Frequencies and Percentages	Personality Types			
	ISTJ	ISFJ	INFJ	INTJ
f	19	0	1	10
%	22,3 4%	0,0 %	1,1 8%	11,7 6%
	Personality Types			
	ISTP	ISFP	INFP	INTP
f	3	1	1	9
%	3,53 %	1,1 8%	1,1 8%	10,5 8%
	Personality Types			
	ESTP	ESFP	ENFP	ENTP
f	2	0	5	12
%	2,35 %	0,0 %	5,8 9%	14,1 2%
	Personality Types			
	ESTJ	ESFJ	ENFJ	ENTJ
f	17	0	0	5
%	20,0 0%	0,0 %	0,0 %	5,89 %

Legend:

(ENTP) Extravert Intuitive with Thinking and Perceptive	(ISFP) Introvert Sensing with Feeling and Perceptive
(ENFJ) Extravert Intuitive with Feeling and Judgmental	(ISTJ) Introvert Sensing with Thinking and Judgmental
(ENFP) Extravert Intuitive with Feeling and Perceptive	(ISTP) Introvert Sensing with Thinking and Perceptive
(ENTJ) Extravert Intuitive with Thinking and Judgmental	(ISFJ) Introvert Sensing with Feeling and Judgmental
(ESFJ) Extravert Sensing with Feeling and Judgmental	(INFJ) Introvert Intuitive with Feeling and Judgmental
(ESTJ) Extravert Sensing with Thinking and Judgmental	(INFP) Introvert Intuitive with Feeling and Perceptive
(ESTP) Extravert Sensing with Thinking and Perceptive	(INTP) Introvert Intuitive with Thinking and Perceptive
(ESFP) Extravert Sensing with Feeling and Perceptive	(INTJ) Introvert Intuitive with Thinking and Judgmental

In our sample there is no equal representation of all 16 personality types. The most frequent is the ISTJ type with 22.34%, and the least represented types are INFJ, INFP and ISFP, with 1.18% each.

We can also note that 4 personal types of are not represented at all - ISFJ, ESFP, ESFJ and ENFJ. They are all with F-preference (preference for decision-making).

Chart 1. Distribution of personality types in our sample expressed in%

It would be interesting to look at the distribution of personality types in relation to the gender (Table 2 and Chart 2)

Table 2. Distribution of the types of personality in the whole sample and according to the gender

Gen der	Personality types															
	IS TJ	ES TJ	EN TP	IN TJ	IN TP	EN TJ	EN FP	IS TP	ES TP	IN FJ	IN FP	IS FP	IS FJ	ES FP	ES FJ	EN FJ
Mal e %	26, 68	23, 41	10, 65	8,5 2	4,2 7	10, 65	6,3 9	4,2 7	2,1 3	0,0 0	0,0 0	2,1 3	0, 00	0,0 0	0,0 0	0,0 0
Fem ale %	15, 80	15, 79	18, 42	15, 79	18, 42	0,0 0	5,2 6	2,6 3	2,6 3	2,6 3	2,6 3	0,0 0	0, 00	0,0 0	0,0 0	0,0 0
Tota l %	22, 34	20, 00	14, 12	11, 76	10, 58	5,8 9	5,8 9	3,5 3	2,3 5	1,1 8	1,1 8	1,1 8	0, 00	0,0 0	0,0 0	0,0 0

Chart 2. Distribution of male and female respondents according to the personality types expressed in%

The most frequent type among males is the ISTJ type with 26.68%, while the lowest frequent types are ESTP and ISFP with 2.13%, each. INFJ, INFP, ISFJ, ESFP, ENFJ, ESFJ are not represent at all.

The female's most frequent types are ENTP and INTP with 18.42%, and the lowest frequent types are ISTP, ESTP, INFJ, INFP with 2.63% each. Not being represented at all - ENTJ, ISFP, ISFJ, ESFP, ESFJ, ENFJ.

Result Related to Preferences of the Personality Types

If we analyze the distribution of the respondents in relation to the four types of preferences in the whole sample, as well as in relation to the sex, the following conclusions are obtained:

a) Preferences for Extraversion (E) and Introversion (I)

- 51.76% of respondents have a preference for introversion, while 48.24% have preference for extraversion. Although the preference for introversion is more represented than preference for extraversion, there is, however, no statistically significant difference between them ($\chi^2=0,14$ df=1, $p> 0,05$).

- If we look at the relation between preference for extraversion and introversion for males and females, we will find out the following results:

- In male dominated extraversion (53.19%) compared to introversion (46,81%), while the female ratio is 42.1% for extraversion and 57.9% for introversion, but this difference does not statistically significant ($\chi^2 1,034$ df = 1, $p> 0.05$). (Table 3)

Table 3. Frequency of preferences for extroversion (E) and introversion (I) related to gender and the sample as a whole

	Preferences					
Gender	Extraversion (E)		Introversion (I)		Total	
	f	%	f	%	f	%
Male	25	53,19	22	46,81	47	100,00
Female	16	42,10	22	57,90	38	100,00
Total	41	48,24	44	51,76	85	100,00

$$\chi^2=1,034 \quad df=1 \quad p> 0,05$$

Chart 3. Representation of preferences - extraversion (E) and introversion (I) according to the sex of the respondents

b) Preferences for Sensing (S) and Intuitive (N)

- 50.59% of all respondents have a preference for intuition, while 49.41% have a preference for Sensing. Also, there is a greater representation of the Intuitive preference, in relation to preferences for sensitivity, but this difference is not statistically significant.

- If we look at the relationship between the preferences for Sensing and Intuitiveness of the male and female respondents, we will find the following:

- For male respondents, preference for Sensing predominates (59.57%) in relation to Intuitive preference (40.43%), while female predominates Intuitive preference (63.2%) in relation to Sensing preference (36.8%). However, this difference is not statistically significant ($\chi^2 = 1.83$ df = 1, $p > 0.05$) (Table 4).

Table 4. Representation of preferences - Sensing (S) and Intuitive (N) according to the gender of the respondents and the sample in the whole.

Gender	Preferences				Total	
	Sensing (S)		Intuitive (N)		f	%
	f	%	f	%		
Male	28	59.57	19	40.43	47	100,00
Female	14	36.80	24	63.20	38	100,00
Total	42	49.41	43	50.59	85	100,00

$$\chi^2 = 1,83 \quad df = 1 \quad p > 0,05$$

Chart 4. Representation of preferences - Sensing (S) and Intuitive (N) according to the gender of respondents

c) Preferences for Thinking (T) and Feeling (F)

- Even 90.58% of all respondents have a preference for Thinking, while 9.42% have preference for Feeling. It was found that there was a statistically significant difference at the level of significance of 0.01 ($\chi^2 = 56.01$ $p < 0.01$) (Table 5)

- If we look at the relationship between the preference for Thinking and Feeling of the male and female respondents, we will find the following:

- The male respondents predominate Thinking preference (91.49%) in relation to the Feeling preference (8.51%), while the female also dominate the Thinking preference with 89.47% in relation to the Feeling preference represented with 10.53% and it does not represent a statistically significant difference.

Table 5. Representation of preferences - Thinking (T) and Feeling (F) according to the gender of the respondents and the sample in whole

Gender	Preferences				Total	
	Thinking (T)		Feeling (F)		f	%
	f	%	f	%		
Male	43	91.49	4	8.51	47	100,00
Female	34	89.47	4	10.53	38	100,00
Total	77	90.58	8	9.42	85	100,00

$\chi^2=56,01$ $df=1$ $p < 0,01$

Table 5. Representation of preferences - Thinking (T) and Feeling (F) according to gender of the respondents and the sample in whole

d) Preferences for Judgmental (J) and Perceptive (P)

- 61.17% of all respondents have a Judgmental preference, while 38.83% are with Perceptive preference. However, this difference is not statistically significant

- If we look at the relation between the preferences for Judgmental and Perceptive in the male and female respondents, we will find the following:

- The male respondents predominated the Judgmental preference (70.21%) in relation to the Perceptive preference (29.79%), while the female equality represented both the Judgmental and the Perceptive preference of 50.00%. And there is no statistically significant difference between masculine and feminine ($\chi^2 = 1.70$ df = 1, $p > 0.05$) (Table 6).

Table 6. Representation of preferences - Judgmental (J) and Perceptivity (P) according to gender of the respondents and the sample in whole

	Preferences					
Gender	Judgmental (J)		Perceptive (P)		Total	
	f	%	f	%	f	%
Male	33	70,21	14	29,79	47	100,00
Female	19	50,00	19	50,00	38	100,00
Total	52	61,17	33	38,83	85	100,00

$$\chi^2 = 1,70 \text{ df} = 1, p > 0,05$$

Chart 6. Representation of preferences - Judgmental (J) and Perceptive (P) according to gender of the respondents

What leaves a particular impression when we look at the results of the four preferences among respondents is as follows:

- The percentage of respondents with Intuitive preference is higher (50.59%) compared to the types of person with Sensing preferences (49.41%). Although there is no significant difference between these two preferences, however, the representation of the Intuitive preference may be considered as one of the features of our specimen. For comparison, these types of personality in the general population are at least represented and with much lower percentage.

- In our sample, 90.58% of respondents have Thinking preference, while those with Feeling preference are represented only with 9.42%, which also deviates from the distribution in the general population.

e) Psychological Functions

If we analyze the distribution of respondents in relation to psychological functions, we note that the combination is the most common – Sensing with Thinking (ST) with 48.24% of the respondents. The combination - Intuitive with Thinking (NT) is the second most common with 42.35%. Next is combination – Intuitive with Feeling (NF) with 8.24%, while the lowest is combination –Sensing with Feeling (SF) with 1.17%.

Table 7. Representation of psychological functions according to gender of the respondents and the sample in whole

Psychological Functions	Male		Female		Total	
	f	%	F	%	f	%
Intuitive with Thinking (NT)	1 6	34,05	20	52,63	36	42,35
Intuitive with Feeling (NF)	3	6,38	4	10,52	7	8,24
Sensing with Thinking (ST)	2 7	57,45	14	36,84	41	48,24
Sensing with Feeling (SF)	1	2,12	0	0,00	1	1,17

Chart 7. Representation of the psychological functions according to gender of the respondents

If we look at these combinations of psychological functions in relation to gender, we will obtain such data:

- The most frequent combination of male is – Sensing with Thinking (ST) with 57.46%, while female are represented with 36.84%.

- The most common combination of female is – Intuitive with Thinking (NT) with 52.63%, while in male it is represented with 34.04%.

- We can disclose that the distribution of male and female respondents is almost identical and vice versa in relation to these two most common combinations of psychological functions. No statistically significant difference was found ($\chi^2 = 1.735$ df = 1 $p > 0.05$). (Table 7).

Table 8. Representation of psychological functions - Sensing with Thinking (ST) and Intuitive with Thinking (NT) according to gender of the respondents and the sample in whole

Gender	Psychological Functions			
	Sensing with Thinking (ST)		Intuitive with Thinking (NT)	
	f	%	f	%
Male	27	57,45	16	34,05
Female	14	36,84	20	52,63
Total	41	48,24	36	42,35

$$\chi^2=1,735 \text{ df}=1, p>0,05$$

Chart 8. Representation of psychological functions - Sensing with Thinking (ST) and Intuitive with Thinking (NT) according to gender of respondents

Conclusions

The results showed differences between participants of different sex in terms of preferences. In the first set of preferences (E-I), a bigger number of male preferred Extroversion E (53.19%), but the bigger number of female preferred Introversion (I) (57.90%).

In the second set of preferences (S-N), the bigger number of male preferred Sensing (S) (59.57%), but a bigger number of female preferred Intuition (N)

(63.20%). Comparing with general population, the preference for Intuition is higher in our sample.

In the third set of preferences (T-F), the majority of male (91.49%) and female (89.47%) preferred Thinking (T), compared to Feeling (F). There is statistically significant difference between the preferences for Thinking and Sensing to a level of 0,01 (χ^2 (1; N = 85) = 56,01 p <0,01)

In the fourth set of preferences (J-P) we find out that a high percentage of respondents have a preference for Judgment (61.17%), in relation to those with a preference for Perception (38.83%). This difference is statistically significant at the level of 0.05 (χ^2 (1; N = 85) = 5.18 p <0.05). Looking for gender distribution 70.21% of male preferred Judgment (J), however the number of female who prefer Judgment (J) (50 %) is equal to the number of women who prefer Perception (P) (50 %).

The findings regarding the dominant psychological functions show that: in the male prevails the combination of Sensing (S) with Thinking(T) (57.45 %), while in the female prevails Intuition (N) with thinking (T) (52.62 %). We can conclude that almost $\frac{3}{4}$ of the respondents have the dominant function of Thinking (T) or Intuitive (N).

FACTORS AFFECTING GLOBAL COMPETENCE IN HIGH SCHOOL STUDENTS

Abstract

The landscape of Macedonian high schools is quite diverse. Some of the high schools are quite multiethnic and multicultural. In most cases, high school students with aspirations to study abroad enroll in private high schools. Furthermore, 98.55% of all high school students study English as a first mandatory foreign language; German, French and Italian are considered secondary foreign languages students choose from. On the other side, one of the greatest promoters of non-formal education in Macedonia is the NGO sector assisted by foreign donations. All these factors listed above influence the global competencies students have and their decisions to study abroad. The results presented in this proposal rest on a comparative study which focused on high school students in their second, third and fourth year coming from public and private schools in Southwestern Macedonia. The choice of the students was made very carefully – almost the same number of students coming from public and private high schools participated in the survey. The research offers a quantitative analysis of the findings obtained via the PISA 2018 Global Competence Questionnaire related to the global competence Macedonian high schools students possess. The findings are quite significant and reveal that although students from private high schools can more easily explain global processes and issues than students from public high schools, the overall percentage of all students that could do this easily is less than 50%. These high school students don't feel like world citizens and don't think they can make a difference in the world.

Key words: global competence; high school students; external factors; OECD; PISA-2018-Global-Competence-Questionnaire

Introduction

The supporters of the global competence education strongly believe that today's students need to be able to draw on and combine the disciplinary knowledge and modes of thinking acquired in schools to ask questions, analyze data and arguments, explain phenomena, and develop a position concerning a local, global or cultural issue". This means on the way of becoming world citizens students nowadays should be "aware of the cultural values and beliefs of people around them, create opportunities to take informed, reflective action and have their voices heard.

In 2015, 193 countries committed to achieving the 17 Sustainable Development Goals (SDGs) of the United Nations. This motivated numerous education institutions and organizations around the world to work really hard in implementing these goals in today's classrooms, finding the educators the most responsible for empowering students on this path. On the other side, the OECD Programme for International Student Assessment (PISA) included global competence in its metrics for quality, equity and effectiveness in education for the first time ever in 2018. PISA conceives of global competence as a multidimensional, lifelong learning goal. Globally competent individuals can examine local, global and intercultural issues, understand and appreciate different perspectives and world views, interact successfully and respectfully with others, and take responsible action toward sustainability and collective wellbeing.

This research offers a quantitative analysis of the findings obtained via the PISA 2018 Global Competence Questionnaire related to the global competences Macedonian high schools students possess. The results presented rest on a comparative study which focused on a group of high school students coming from public and private schools in Southwestern Macedonia. The group is composed of high school students who are in their second, third and fourth year of high school in three cities in Southwestern Macedonia: Bitola, Ohrid and Struga;

This research aims to demonstrate the advantages students have when they study in private high schools, participate in youth development NGO programs or study abroad preparation program and what impact that has on their level of self confidence, open-mindedness, and readiness to embrace challenges. Their entire approach to the learning process in general changes considerably due to the valuable experience they gain in the process of learning about other cultures and societies.

Educational advisers, NGO representatives and various stakeholders working on the topic of supporting global competence development in youth will be able to learn more about some of the unique approaches to global competence education Macedonian formal and non-formal educational institutions use and practice and share their best practices and contribute to further develop tools, methods or practices that can be used and transferred in other countries and contexts.

Theoretical Background

Although we may inhabit different geographies, cultures, families and political systems with distant others, we are increasingly bound together by a single fate and shared identity. In a world that is smaller and yet more complex than ever before, our educational challenge is to understand and to value our differences and our commonalities, our separateness and our togetherness (Slimbach, 2010).

The issue nowadays is that nowhere do policymakers or educators have ready answers about how to embed global competence in schools and learning. A big part of the problem is that there is no clear definition of what global competence should embrace, and how to make it measurable for educational policy and practice.

Andreas Schleicher, the Director for the Directorate for Education and Skills at OECD and coordinator of PISA, believes that promoting global education is essential for three key goals:

- Develop intercultural awareness and respectful interactions in increasingly diverse societies to limit cultural prejudices and prevent violent conflicts;
- Support employability by helping young people more easily adapt, apply and transfer their skills and knowledge to new cultural contexts;
- Form new generations who care about global issues and get engaged to solve social, political, economic and environmental challenges.

Veronica Boix Mansilla, principal investigator with Project Zero at Harvard Graduate School of Education, worked closely with OECD analyst Mario Piacentini and a small expert team, including doctors Martyn Barrett, Darla Deardorff, and Hye-Won Lee in the construction of the PISA framework. Up to now the PISA assessment focused on math, science and reading. From 2018, it is expected that the new PISA global competence tests will impact curriculums in schools around the world.

Macedonia's PISA score has fallen since the last time it participated (2000). Macedonia is now ranked fifteenth out of the sixteen peer countries that also participated in PISA 2015. In 2000, Macedonia was ranked fifth out of eight among its peers. Since 2000, Albania, Indonesia, and Peru have overtaken Macedonia in terms of their PISA scores.

Achieving global competence through education will require significant changes in the classroom. Some national curricula now put emphasis on education for sustainable development and intercultural education. Many teachers also encourage students to analyze and reflect on the root causes of global issues, and share ideas on possible solutions. However, progress has been uneven and good practices have not been shared sufficiently at the international level.

Methodology

The global competence assessment in PISA 2018 is composed of two parts: a cognitive assessment and a background questionnaire. The cognitive assessment is designed to elicit students' capacities to critically examine global issues; recognize outside influences on perspectives and world views; understand how to communicate with others in intercultural contexts; and identify and compare different courses of action to address global and intercultural issues. In the background questionnaire, students will be asked to report how familiar they are with global issues; how developed their linguistic and communication skills are; to what extent they hold certain attitudes, such as respect for people from different cultural backgrounds; and what opportunities they have at school to develop global competence.

This research draws on a quantitative analysis of the PISA background questionnaire conducted among high school students from public and private high schools in Macedonia. In fact, the results are obtained via a comparative analysis of the responses of students from public vs. students from private high schools.

With the questionnaires we were able to collect rich international data on important social skills and attitudes, such as adaptability, openness, respect, and civic engagement. 55 students in total responded to the survey – 31 students coming from public and 24 students from private schools. Respondents come from the

following public high schools: Josip Broz Tito – Bitola (17), Niko Nestor-Struga (6), Sv. Kliment Ohridski – Ohrid (2) and Ibrahim Temo-Struga (5) and from one private high school Yahya Kemal College in Struga (24). 45 of the respondents are Macedonians, 5 are Albanians and 5 are Turkish. Students' home towns include: Bitola, Ohrid, Struga, Kichevo, Demir Hisar and Resen. 30% of the students live in another town than their home town in order to attend high school.

The PISA questionnaire consisted of 15 questions with 80 sub-questions in total. The survey was conducted online and it was carried out in a period of one week.

Results of the Research

Our findings confirm students from private high school can more easily explain global processes and issues than students from public high schools. Nevertheless, the overall percentage of all students that could do this easily is less than 50%.

In terms of civic activism, we are dealing with a dormant youth. More than 50% of the students are not aware in the benefits of purchasing products for ethical and environmental reasons; around 60% of the students do not sign environmental or social petitions; more than 80% of the students got the information through Facebook or Twitter. 70% of the students do not boycott products for political, ethical or environmental reasons. Students are more active when it comes to dealing with gender issues and activities for environmental protection.

Students' interest in other cultures, religions and traditions is high though. More than 60% of all students reported that they are interested to learn how people from different countries live and how people from various cultures see the world.

In terms of students' contact with people from other countries, most of the students from private schools have contact with foreigners at school and in their circle of friends whereas more than 80% students from public schools reported that they have contact with people from other countries in their circle of friends and less at school or in their neighborhoods.

When speaking about tackling world's problems, majority of the respondents don't see themselves as citizens of the world. Less than 50% of the students feel responsibility to do something about poor leaving conditions in other countries. Less than 30% of all students strongly agree that their behavior can impact people from other countries. Less than 33% of all students agree that they can do something about the problems of the world. Less than 45% of the students strongly agree that it is important to them to look after the global environment.

In terms of immigration issues, around 50% of students from public schools agree with statements that immigrant children have the same opportunities for education that other children in the country have, that immigrants should have the rights to vote in elections and that immigrants should have the same rights as everyone else in the country. Students from private school seem more conservative on this question and their answers vary on each of these statement.

In terms of language competences, around 45% of all students said that they and their parents speak four or more languages well enough to converse with others, including the language they speak at home. Students from private schools learn more foreign languages than students from public schools.

In high percentage, students, both from private and public schools, stated that at school they learn about interconnectedness of countries' economies, how to solve problems, about different cultures, celebrate cultural diversity or participate in classroom discussion about world events. But, the big issue at the current educational system in Macedonia is that only a third of the students at private schools reported that they are invited to share their opinion on international news during classes or 22% of the students at public schools do this. More than a half of the students said that they don't analyze global issues together at class and over 80% of the students clarified that they don't read or discuss international news during class.

Finally, almost half of the students reported that some of their teachers have misconceptions about the history of some cultural groups and blame people of some cultural groups for problems faced by Macedonia.

Conclusion

What makes the new OECD PISA framework exciting, in my view, is not only its clear potential to help us gauge how 15-year-olds today think about pressing issues of local, global, and intercultural significance, but also its power to inform educational practice in every region of the world," said Boix Mansilla.

With that being said, the recommendation is that the new PISA framework will give us the opportunity to learn a lot about what schools and teachers in different countries are doing to promote the knowledge, skills, attitudes, and values that make people globally competent. As to a possible further research, it'll be really interesting to examine school principals and teachers on these same questions and topics and measure their global competence levels as a starting point for any relevant changes that need to be undertaken in this direction in future.

THE ROLE OF FORMAL EDUCATION AND MEDIA IN RAISING THE LEVEL OF MEDIA LITERACY IN THE REPUBLIC OF MACEDONIA

Abstract: Media literacy should enable young people to analytically and critically think regarding the contents aired by the media. Hens, it is essential for the media literacy to be an integral part of the educational process, this paper is focused on the connection between the media literacy and the formal and informal education in the Republic of Macedonia. Media literacy of an individual plays a key role for him to have a formed critical thought and to be an active stakeholder in the society's democratic processes.

Key words: *media, education, media literacy, society, democracy*

Introduction

Digitalization has a positive impact on the media offer, enabling the users to have more platforms where they can get information⁴ and proceed them. However, the quality of that depends on the media literacy.

Media literacy is defined as a capacity to access, analyze and critically assess and create new media contents (Kanjizaj, 2014). At the same time it has 3 dimensions (Livingstone and Thumim, 2003): technical competencies, practical skills for critical thinking and producing contents. From the media literacy, by which technical, critical and practical skills are developed, it depends how much will the individual have a formed critical thought to distinct facts from propaganda (Sikic T.).

Oppose to the traditional literacy, gaining media literacy is a complex process that demands a capability of reading the “all-present fast and strong pictures and sounds of multimedia culture” (Sikic, 2014). He who is lacking that kind of literacy will remain excluded and isolated (Giddens, 2005).

According to the project “Young people and usage of new media” the number of those who get informed by internet is growing, mainly the younger generation that perceives the internet as a social network. All the respondents in the project said that the only media they could not imagine life without is the mobile phone.⁵

⁵ Youth and usage of new media, Ipsos Strategic Marketing and IREX Serbia, (2010-2012) pg.5.

Young people today spend twice as much time on electronic media (TV, internet, video games, mobile phones..) then on formal education. Therefore, the question arose as to who educates the youth and casts them the roles that they imitate.¹ Furthermore this is more complex, when we take in to account that, as oppose to the past, when literacy meant reading and writing, today literacy demands contemporary skills, including information and media literacy. In that way the individual can receive, create and pass on information.

According to E.Thoman (2004) in a society under strong influence by the media, for a person to be functional, each adult must know to pose the basic questions about everything he sees, reads or hears. The hunger for information means an individual should not wait to be spoon-fed by someone (Berry, 2006).

Analytical thinking is built by media literacy. A media illiterate individual is a passive receiver of information. Citizens will provide democratic participation in society only by proactive approach. Media education is a basic right of every citizen.²

In Macedonia in recent years many projects for media literacy are realized, but the actual situation on the field, indicates that more work is necessary. In conditions of polarized media space, dispersed propaganda and sensationalism, the insufficient media literacy additionally makes the situation more complex.

Education, Media and Media literacy in the Republic of Macedonia

Media literacy in Macedonia is a relatively new concept. There is no research about how the citizens approach the media and how critically they can assess the contents and express a position of theirs through the media. The efforts for media literacy are facing difficulties because of insufficient resources (human, technical, technological..). The Macedonian legislation, until 2014, has not mentioned media literacy. Only several strategic documents (national programs and strategies) suggest the need of promoting and developing media literacy. However, they speak more of informatics and digital, rather than media literacy. (Shopar, Kjupeva, Temenugova, 2016).

A research³ of the Macedonian Institute for Media published in 2016 assesses that the general condition of journalism and the professional standards in the media are at a very low level. A survey⁴ of “Freedom House” in 2016, has placed Macedonia in a group of not free countries. The situation partially improved

¹ Media and information Literacy and Education, (Available on: http://www.mediaeducationcentre.eu/eng/?page_id=2939, accessed on 18.01.2018).

² Commission of the European community’s white paper on a European communication policy Brussels

³ The research is carried out as part of the project “Partnership of Southeastern Europe for media development”, realized by the Centre for independent journalism from Romania, and supported by the European Commission.

⁴ Macedonia, Freedom of the press 2016, Freedom house (Available on: <https://freedomhouse.org/report/freedom-press/2016/macedonia>, accessed on: 10.12.2017)

in 2017 and 2018. The report from 2018 has classified Macedonia in a group of partially free countries.¹

In the past years there has been a trend of shutting down bachelor studies of journalism. Until 2016, such studies existed on 6 faculties, after which the number dropped to 4. High journalist, bachelor education, can be acquired on 3 state Universities and 1 private-public institution. There are postgraduate programs for media and communications on the Institute for sociological and political research and the Institute for communicational studies. There is a lack of media practice, and the number of students is also dropping. In 1977, 200 students enrolled on journalism, while 40 years latter only 20 students applied.²

Negligence of the professional standards in journalism and the crises in the media sphere have a negative impact.³

Media literacy is not studied enough in the primary formal education, all though various aspects are treated in certain subjects (Macedonian language and literature, sociology, informatics, ethics, civic culture, drawing art and pedagogy). The Agency for audio and audiovisual media services has a legal obligation to promote media literacy. It does so through a Network for media literacy of Republic of Macedonia that is connected with policy creators, media, educators and civic organizations. Non of the less, there is still space for improvement of activities.

However, there are good practices of media literacy of young people in the non-governmental sector. Such an example is the project “Media literate student” for education of the student population⁴, which is crucial for the society’s processes and democracy, because the student is a carrier of the progressive society change.⁵ The project “Youth Media literacy”⁶ has realized training for young people from the marginalized communities, with an accent on media literacy, propaganda and distinguishing between ethical and unethical journalism.⁷ In 2016 by awarding grants to 8 civic organizations the journalism and public relations Collage has founded the Coalition for media literacy, which has started projects for education of the public to critically percept information, as well as to use the media as a tool to articulate its interests.⁸

⁸ Collage for journalism and public relations

Conclusion observations

Young people in Macedonia are not enough media educated to assess and recognize the influence of media. Spending much time on the Internet they are exposed to media influence, but are lacking the skill for critical assessment of the contents. The development of individual critical thinking and acquiring skills needed for participation in the society and political life, are in the middle of the media literacy, that will enable active civic population and complete democracy (Celot, 2012:82).

Given that the young people in all developed societies are the carriers of progressive changes, only enhances the need for stepping up the efforts for media education of young people in Macedonia. The curriculum in primary as well as in high school should be changed. Besides informatics, in schools the segment of media literacy should be studied. Recommendations are in direction that media literacy should be introduced in primary education, initially as an optional subject. According to a document of UNESCO from 1998 the educative program for media literacy has a role in the protection of the minor and human dignity through audiovisual and information services.

The faculties should have an important role, with active journalism studies. They should initiate a broad debate that will point out the need of reforming the curriculum for journalism and introduce education for media literacy on other faculties as well. The possibility of opening new studying programs, should not be excluded.

Also, there is a need of education of the present and future journalists in the media, with an accent on the influence that they carry out through media and the need of responsible presentation of the news. The journalism students should get conditions to practice, and the media should recognize their interest in the production of the enabled journalism personnel.

In the whole process, it is necessary to systematically include all the stakeholders, such as: The Department of education and science, The Department for informatics society and administration, The Agency for audio and audiovisual media services, educational institutions and the non-governmental sector as a way to include the citizens. The adaptation of policies for media literacy is crucial for using the full capacity of media literacy.

BUILDING MANAGERIAL COMPETENCES THROUGH THE SYSTEM OF HIGHER EDUCATION IN THE REPUBLIC OF MACEDONIA

Abstract

This paper is based on conclusions and recommendations of the fundamental scientific researches conducted over the last decade and contributes to the creation of the path of managerial education in the Republic of Macedonia.

Education is a complex social element and one of the main links between economy and the need of professional workforce. Creating study programs and their effective implementation is a serious task for higher education institutions and they must be highly competent, realistic and aware of the real need of society.

Direct beneficiaries of the results of this paper are:

- Educational institutions, research institutes and researchers.
- Undergraduate and postgraduate students.
- Executive directors and management teams in organizations.

Keywords: *higher education, study programs, competencies.*

Introduction

This paper is a sublimation of the theoretical foundations and the empirical results of scientific research for the need of professional management and the building of competent higher education personnel at all levels of management and customized experiences for the Republic of Macedonia.

The challenge of contemporary competency theory is to develop a consistent and coherent typology of competence, even in countries where there is an apparent diversity in approaches. Each of the four dominant approaches has particular strengths.

The traditional American approach has shown the importance of individual characteristics and the use of behavioral competence as a mean of developing superior performance. The British approach has shown the value of professionally defined standards of functional competence and their applicability in the workplace. The approach adopted in France and Germany demonstrates the potential of a multi-dimensional and more analytical concept of competence. In addition, there are signs of convergence in national approaches to competences, not only in Europe, but also between European and American models, which indicates that there is value in a multi-dimensional approach to developing a global understanding of this term.

Scientific initiatives in the United States, the United Kingdom, France and Germany have been continuously seeking to clarify the concept of competence for decades by incorporating knowledge, skills and competencies within a holistic typology of competence. One-dimensional framework of competence is inadequate

¹ Professor Ph.D., Business Academy Smilevski - BAS, Skopje, sokle2000@yahoo.com

and paves the way for multi-dimensional frameworks. Functional and cognitive competences are increasingly added to the model of behavior competencies in the United States, while in the UK cognitive and behavioral competencies are added to the model of professional functional competence. France, Germany and Austria, which entered the arena, have recently adopted more holistic but different approaches from the very beginning. After comparing these approaches, one should bear in mind that the holistic framework is useful in identifying the combination of competencies needed for certain professions and promoting the mobility of the workforce.

Managerial work is complex and requires every manager competencies for its execution. The relative importance of each competency varies according to the level of management the manager is engaged in. The manager can not concentrate his effort only on one competency or several of them. It should combine competencies in the right proportions depending on the level of management, and this can best be achieved if it has received high quality higher education in this field.

1. World Practices for Building Mechanisms in the Field of Management Competence

The concept of competence generally dominated the 1990's strategic management literature, which emphasized "core competence" as a key organizational resource that could be used by organizations to gain a competitive advantage (eg Campbell and Sommers Luchs, 1997; Mitrani et al, 1992; Nadler and Tushman, 1999).

Hamel and Prahalad (1994) defined the essential competence as "collective learning in the organization, in particular how to coordinate different production skills and integrate multiple streams of technologies" (Prahalad and Hamel, 1990: 82). From a resource point of view, human resource competencies may be unique or rare, difficult for competitors to imitate and are irreplaceable due to their invaluable role in the concept of added value. (Cappelli and Crocker-Heftel, 1996; Ellestrom, 1992; Foss and Knudsen, 1996). The basis of the essential approach to competence is that it recognizes "the complex interactions of people, skills and technologies that encourage effective work and consider the importance of learning and are the path of dependence in their evolution." (Scarborough, 1998: 229).

While management strategies emphasized the competencies that are unique and rigid-specific, the human resource management literature was more concerned with developing highly transferable core (joint) competencies that are required for most jobs or typical for professions or work roles (Levy- Leboyer, 1996; Stasz, 1997).

There is an inseparable tension between strategy and human resource development approaches. If we concentrate on specific competences that are "characteristic and specific to each individual organization, it is what gives it a competitive advantage." (Bergenhenegouwen et al., 1996)

An approach based on competence in the development of human resources and vocational education and training (VET) was governed by several factors, some global in nature, others particularly European. First, and universally, the pace of technological innovation in products and processes, coupled with demographic changes, has increased the importance of adaptive and cost-based training in the

agenda of human resource development. This need led to a second global factor, replacing traditional education systems with models that benefit externally connected systems of (usually described as "Competency-Based") VET VET. Third, and especially in Europe, lifelong learning policy highlights everyday learning and non-formal learning that will lead to initiatives such as personal skills and accreditation skills systems to identify and validate competencies.

This accent policy is related to the fourth factor, the support of "social Europe", because the recognition of learning outcomes, regardless of the paths of acquisition, rather than inputs in terms of time spent in learning institutions, is the key to expanding access to learning and providing "scales" for those who have fewer opportunities for formal education and training, yet have developed competence in an empirical way. The fifth factor, also related to the objectives of the European Lifelong Learning Policy, is the potential of an approach based on the competence to integrate traditional education, vocational training and experiential development. The sixth factor, elaborated in the European Employment Strategy, is the need to improve the skills and qualifications of the workforce and to promote labor mobility by building joint reference levels of professional competence.

Regarding this generic competence approach, the development of an appropriate typology of competence is important for integrating education and training, aligning and meeting the needs of the labor market and promoting mobility for individuals (both vertical and career advancement, lateral as the movement between sectors and geographically), especially for workers who face job insecurity (van der Klink and Boon, 2002).

This paper explores the different definitions and the use of competence, comparing the three dominant approaches in the United States, Britain, France, Germany and Austria, which developed more or less independently, and, comparing them, seeks to clarify the concept by incorporating knowledge, skills, competence and competencies within the typology of holistic competence.

Because competencies are centered on the individual, they are perceived as independent of the social context and the context of specific tasks in which performance is performed, yet "the level of skill is a characteristic of not only one person but also a context. They have no competencies independent of the context." (Fischer et al., 1993: 113). Constructivistic and interpretive approaches emerged from the competence of the phenomenological view as a function of the context in which it is applied, where "a worker and work form one subject through the surviving work experience" (Sandberg, 2000: 50). Competence is constituted by the importance that the worker has for the worker and in his experience. (Stoof et al, 2002; Velde, 1999).

In terms of terminological and conceptual confusion over competencies, it started with three dominant approaches that began relatively independently, first in the US, then in the UK and more recently in France and Germany. These approaches are in contrast before proposing a comprehensive holistic typology of competence.

Much of recent American literature focuses on work-related competencies (functional) (Aragon and Johnson, 2002; Boon and van der Klink, 2002), often related to the support of behavioral competencies. For example, in the influential

model of competent leadership developed by Holton and Lynham (2000), six "competent domains" have been identified in relation to the performance of the organization, process, and individual level. These domains are broken down into "competent groups", and are further subdivided into "sub-competencies".

Efficiency at the level of an organization, both domains of competence, have been identified as strategic thinking and strategic leadership, under which there are four and five skill sets with more sub-competencies. (Collins et al., 2000). Similarly, in the process, both domains of identifying competence are a managed process and a planning process, each split into three sets of competences with more sub-competencies (Baker et al., 2000). At the individual level, both domains of competence, employee efficiency, and staff assessment are further subdivided into four sets of competences with more sub-competencies (Wilson et al., 2000).

All of these competencies are based on workplace-related standards rather than behavioral competence (although some are clearly underpinned by behavioral competencies). While the approach to behavioral competence promoted especially by David David McClelland and Hay-McBer is still evidence in the United States as a broader concept of competence that emphasizes functional skills and support for workplace-related knowledge.

The new vocational qualifications (National Vocational Qualifications, ie Academic, in England and Wales, Scottish Vocational Qualifications, SVQs, in Scotland) created in this framework were based on professional standards of competence, grounded in functional occupational analysis in different contexts (Mansfield and Mitchell, 1996). Other (non-NVQ / SVQ) vocational qualifications continued to exist together. Managerial standards, for example, were developed and tested with over 3,000 managers, a whole range of sectors (Frank, 1991).

Professional standards identify key roles, which are then decomposed into a number of units of competence. These are further divided into several elements of competence, for each element of competence there are performance criteria and they define the basis of assessment, with a range of indicators in the foreseen guidelines. Professional standards are firmly rooted in the reality of work (Mansfield, 1993); employers play a leading role in their validation, as well as trade union unions.

However, employers' participation in the formal vocational qualification system is far from universal, partly because of the perceived lack of relevance to the specific needs of the employer and is partly due to the bureaucracy associated with the assessment procedures. The assessment of competencies includes the accreditation of the competence of individuals from actual performance at the workplace, which is designed to ensure continuing importance for the working situation (Miller, 1991), although there is evidence that the assessment fails to notice much of the results of non-formal learning. Continental Europe, two other approaches are evident, the example with France and Germany, which have adopted the competence in their approaches to human resources development in recent times.

2. Building Managerial Competences through the System of Higher Education in the Republic of Macedonia

In the literature, researchers in the field of operations and strategic management are increasingly suggesting the position of an operations and strategic manager at the level of professionalism.

The unsatisfactory results of the work of most production and service organizations in Macedonia, among other things, is due to the inadequate management of human resources in terms of the competencies and working behaviors needed for the efficient and effective execution of organizational strategies.

The basic disadvantage of the organizations in the Republic of Macedonia. Macedonia is a non-existent (or not) functional system for operations and strategic management even in the conditions when the organization has developed and defined competitive strategies, and wider within the framework of the general environment.

In fact, organizations face a problem that is defined as: an inadequate approach to operations and strategic management, expressed through a lack of competent designated operations and strategic managers, leading to unprofessional performance of operations functions in the respective operations areas.

In the period 2006-2014, I made research aimed at the perception of the term operating manager in companies with production and service activities, and for which knowledge, abilities, skills and competencies they should have at their respective workplace. Also, from this research with the help of the instruments: an interview and an observation protocol, the opinions of subordinates (supervisors and workers (executors) as well as superiors (general managers or owners) for their operations managers are collected.

Based on the experience, the direct observation of the positions of the operations managers, the interviews with all levels of management and employees were assessed the necessary characteristics in the scope of work and the requirements set in the work of supervisory, operations and strategic management.

- The design of the research and the creation of the instruments I have realized all these years was based on: previous empirical research and already developed instruments by the most important researchers of the theory of competencies for managers in England and Wales. (Mansfield and Mitchell, 1996). The national vocational qualifications created in this framework are based on professional standards of competence, grounded in functional occupational analysis in different contexts. Managerial standards were developed and tested with over 3,000 managers, a whole range of sectors (Frank, 1991). Professional standards identify key roles, which are then decomposed into a number of units of competence. These are further divided into several elements of competence, for each element of competence there are performance criteria and they define the basis of assessment, with a range of indicators in the foreseen guidelines. Professional standards are firmly rooted in the reality of work (Mansfield, 1993); employers play a leading role in their validation, as well as trade union unions. Employers' participation in the formal

vocational qualification system is far from universal, partly because of the perceived lack of relevance to the specific needs of the employer and in part to the assessment procedures.

- The assessment of competences involves accrediting the competence of individuals from actual performance at the workplace, which is designed to ensure continuing importance for the working situation (Miller, 1991), although there is evidence that the assessment fails to notice much of the results of non-formal learning.

- Observations, experiences, perceptions and findings of the author on the specifics of the research variables in the Macedonian context (national and organizational culture, economic conditions, economic trends, market conditions, social circumstances).

- In this paper, I presented only a small part of the results of the surveyed -over 224 managers, highlighting the differences between the necessary competences, knowledge, level of education, skills, requirements and working style of professional managers and their serious need for professional development. From the analysis in Table 1 and the schematic diagram (Graph 1), you can see differences in arithmetic environments in management levels (Top Managers, Mean = 3.67, Operating Managers, Mean = 3.41, and Line Managers, Mean = 3.49)

Table 1: Differences in the need for competencies between management levels

ANOVA		Levels of management	Sum of Squares	df	Mean Square	F	Sig.
knowledge / education	top operations	Between Groups	12,454	2	6,227	10,084	,000

Chart 1: Levels of required education for strategic, operations and line managers

Much of the decision to create studies in professional and strategic management is based on the need of our society for highly educated staff that will raise the performance indicators in Macedonian organizations and increase their competitiveness.

Conclusion

Once the common and specific competencies of the managers in the Republic of Macedonia have been defined, ie. the influence of the competences as a significant factor for successful and professional performance of the functions will pave the way of building professional managers in higher education at the Business Academy Smilevski in Skopje and Bitola. The past decade existence of this type of higher education fully confirmed and responded to the knowledge gained from the literature on operations and strategic management and the theory of competence.

- This type of higher education contributes:
- Build professionalism in organizations at all levels of management:
- To invest in managers because it will result in a high return on invested capital;
 - In the process of providing, developing, activating and maintaining human resources, take into account the existence of highly educated managers at all levels.
 - Enhanced competencies by higher education managers build national standards of managers in the Republic of Macedonia;

INNOVATIVE LEADERSHIP AS A CONDITION FOR ORGANIZATIONAL SUCCESS - BUILDING LEADERSHIP CAPACITY

Abstract

Human capital, as the collective value of the abilities, knowledge and skills, has dominant significance for the leaders in the contemporary social reality. This paper focuses on the synthesis of the concepts: innovative leadership, emotional competencies and their development that integrate in the context of organizational success. The aim of this paper is to give insights into the trends of innovative leadership styles that provide important business results. Empirical findings in this paper confirm the need to practice innovative leadership styles for organizational success, as well as their connection and conditionality to the emotional competencies of leaders. The findings are in favor of the need for a systematic approach to capacity building for successful leadership. The result of this study has enabled evolving a Model of emotional intelligence by incorporating key competencies for leadership. It is necessary to create trainings for leadership teams in organizations that are focused on developing emotional intelligence and improving the emotional competencies which are a prerequisite for responsible and innovative leadership.

Key words: *organizational success, leadership, emotional competence.*

Introduction

The globalization is a phenomenon that marks the contemporary social reality and has universal reflections and implications on leadership and organizational functioning. Human capital, which is considered to be a collective value of abilities, knowledge and skills, has a dominant meaning in these conditions. The design of effective leadership and development systems that use human capital is a challenge for many leaders who implement new scientific knowledge for innovative leadership. This paper focuses on the synthesis of the concepts of innovative leadership, with an emphasis on transformational leadership, as well as the emotional and social intelligence of leaders. These two aspects are integrated in the context of organizational success and competitiveness.

The concept of this paper is to give an insight into the trends of modern, innovative leadership, where employees inspire themselves to maximize investment in achieving and maintaining a competitive edge. The process of designing programs for the development of the emotional competencies of leaders, managers and human resources is presented by the insights from contemporary world findings. The imperative of this research is to affirm the need and the possibility of innovative leadership through the development of appropriate emotional and social competencies of leaders and managers.

¹ PhD, Associate Prof. Bizinis Academy Smilevski, R. Macedonia

1. Theoretical base

The competition pressures the organizations which ask from their managers, leadership and employees actual knowledge, skills and capabilities in order to achieve better results at work. The organizations face changes in the rival competition while the managers, leaders and the employees need training in order to maintain and upgrade their qualifications. Intrapersonal and interpersonal competencies have large meaning in improving the effective management, the work relations and resolving conflicts. These skills are included in the concept of emotional intelligence. The emotional intelligence (EI) is a contemporary psychological paradigm which unites two aspects of the person – the intelligence and emotions. It is the individual's potential for learning skills such as: self-consciousness, self-managing, social consciousness and relationship management, which are precondition for success in leadership, Goleman (1995).

The theoretical base and the focus on the emotional intelligence are some of the decision making factors for success, besides the technical capabilities and academic intelligence are priority for the scientific valorization of the concept. There is scientific evidence for the influence of EI on the work success. Not until recently, the extraordinary competence and superior intelligence are considered as decision-making factors for success. The work organizations led by this attitude are checking the professional knowledge during the employment process. Even the psychologists gave priority to the test for measuring universal intellectual capabilities, when they had to decide for one of the measuring instruments. Based on the intelligence quotient (IQ), it can be roughly envisioned how much a person is qualified to work. However, the practice constantly shows that the people with solid knowledge and intellectual skills are not necessarily successful leaders and that many people with superior intelligence (IQ 160) work for people with average intelligence (IQ100).

2. Competencies of leaders for organizational success

There are numerous research papers on the competencies of emotional intelligence EI and effective leadership. The technological progress brought changes in the work which became less connected to routine and the leaders became more dependable on the capability to motivate the employees and implement changes. Since the beginning of the technological evolution, leaders have faced difficulties in striving to control less the routine work and to overcome the employees' resistance who did not accept the new norms and values easily. Overcoming these difficulties is closely connected to the introduction of new paradigm in leadership – emotional intelligence (EI). "EI has the potential to contribute to effective leadership in various ways. It is unquestionable that leadership is a process led by emotion, from the both sides' perspective – the leaders and followers", George (2000). One of the most prominent researchers is McClelland, 1998, who warned that the approach which includes prediction of the success based on cognitive capabilities does not give prediction for the success of the individual. Research showed that a lot of people with superior intelligence did not become successful, which is explained with the fact that cognitive capabilities can indicate on the presence or absence of the capacities needed for performing complex operations. It was concluded that 67% of the competencies which are

needed for success in business are based on emotional and social competencies. The results from the McClelland's research, which was carried out in 30 different companies, identify the characteristics according to which extraordinary leaders from prestigious companies differ from the others. Facts from the research show that successful leaders, managers and other employees are not defined by the academic intelligence and their work skill only, but also by their social and emotional competence.

Goleman (1998) presents research findings from 121 different organizations, where the emotional competence has the greatest influence on the professional success of the leaders. It is also shown that the intelligence quotient (IQ) alone is not enough to predict the success and it outflanks around 25% from the variation, Sternberg (1996). The analyses made on qualified staff in 500 organizations, state institutions and non-profit organizations, showed that emotional intelligence is a measure for the success and skillfulness for almost every job.

Another impressive example is the longitudinal 40 year study about the connection of the IQ with the success in work, known as Somerville study, carried out on 450 children. The findings showed that academic intelligence presented through IQ was not much connected with the work success and the other parts of the individual's life. As the most important factors emerged the ability to cope with frustrations, emotion control and getting on well with people, Goleman (1998). Successful leadership includes effective emotion usage, good communication with the employees and motivating the followers to accept and share the vision.

3. Components of successful leadership - emotional and social competencies

Findings from many research papers supported the concept of emotional intelligence presented through emotional and social competencies of the managers and leaders, as components of successful management of the human capital (Gardner, Stough, 2001; George, Bettenhausen, 1990; Palmer, Walls, Burgess, Stough, 2001). The authors concluded that there is evidence for the connection between the emotional competence of leaders and the rival advantage (Palmer, Walls, Burgess, Stough, 2001).

All empiric evidence confirmed that the high level of EI of the leaders is connected to the success and the competitiveness of the organizations. Actually, the connection of EI with the work success is responsible for the great importance of this psychological concept. Goleman (1998) states that the leaders with highly developed emotional capabilities who manage and know well their feelings, can recognize and effectively react to other people's emotions, have advantage in all areas.

Research on the Impact of Emotional Competencies (EC) on leaders and employees in the success of organizations in Macedonia is based on a limited number of research on the impact of emotional intelligence on leadership style. These studies, although not sufficiently, brought specific knowledge of EI's linkages to leadership success, as well as the impact of self-esteem on the effectiveness of leaders and the connection of emotional competence to success in the work.

4. Methodology of the research

The methodology used in this paper is based on contemporary empirical findings about the influence of emotional competence of leaders on the success of the organization and its competitiveness. That is achieved through the comparative approach where findings from this area presented in contemporary literature are compared to theory and empiricism in our conditions. The comparative approach is used on a concrete sample of managers, leaders in profitable organizations and is based on their insights about the need for social competencies (SC) development in a function of competition and also on concrete conclusion for the realization of SC.

The occurrence for research in this paper comes from the influence of the effective management and leadership on the competitiveness in the organizations in contemporary conditions. The problem in this research is how to improve organizational competitiveness or how much can emotional and social competency be a source of rival advantage. Is improvement of the managers', leaders' emotional and social competency going to bring improved quality in the work and rival advantage?

The subject of this research paper is the influence of emotional and social competencies on the rival advantage of the organization.

Aims of the research: Insight of the need for developing the leaders' emotional and social competencies. Methods for developing the emotional and social competencies for leaders, the employees in the function of rival advantage. Ways for using programs about developing the emotional and social competencies

Hypothetical frame: This research starts from the presumption that there is a connection between the degree of the managers' development of emotional and social competence and the flourishing of the organization presented through leadership. The general hypothesis is: Emotional and social competence of leaders' influence the rise in rival advantage of the organization.

Research techniques: questionnaire for assessment of attitudes for the need of development of employee's social and emotional competencies; interview for assessment of the managers' awareness for the importance of the emotional and social competencies; observing.

Measuring instruments used in this research are: Questionnaire for measuring the widespread of contemporary and classic leadership styles- Multifactor questionnaire for leadership- MLQ Bass i Avolio (1998); Questionnaire for measuring the emotional and social competence - Questionnaire for emotional competence, PEK, Taksic (1999).

Population and sample: As a sample, in the research were included 50 managers from first and second level, who are employed in profitable organizations in Macedonia.

5. Presentation and explanation of the results

The results presented are according to the answers from the questionnaires, tests and poll questionnaire given to the respondents. The results show that there is a connection between emotional competence and effective leadership. That connection is confirmed by the existence of high correlation between the transformational leadership maintenance and emotional competencies, and leaders'

social awareness. The emotional intelligence presented with all emotional competencies significantly correlates with transformational leadership ($R=0,61$; $p<0,001$) and validates that managers with higher emotional and social competence prefer effective and modern leadership. The EI competencies take 39.7% in determination of the ability to practice contemporary management styles, which include leadership (Table 1.)

Table 1. Presentation of multiple correlation between EI competencies and transformational leadership style

Respondents	Multiple correlation quotient	Multiple determination quotient	Variance
N	R	R^2	%
50	0,62	0,397	39,7

The managers' emotional and social competence determines the ability to use modern, effective and successful leadership styles, which influences the employees' pleasure, motivation and even reflects the company's success in rival advantage. The percentage in which the four EI competencies: self-awareness, self-confidence, self-management and social awareness take part in effective leadership with 39,7%, which shows that effective leadership need certain level of EI.

In the following table, the correlation between effective leadership and all competencies individually (self-awareness, self-confidence, self-management and social awareness) is presented. Self-management or managing with the emotions, is the best indicator of the effective leadership when it is itself ($r = 0,50$; $p<0,001$). However, when self-confidence is added, the correlation magnifies to 0,56, and the determination quotient goes up to 0,313. When all three competencies are taken into consideration, the correlation magnifies to 0,58 ($p<0,001$), while the determination quotient becomes 0,336. If these predictors are grouped together with self-awareness, self-confidence, self-management and social awareness, then, multiple correlation goes up to 0,61 ($p<0,001$).

Table 2. Correlation between transformational leadership and all EI competencies: self-awareness, self-confidence, self-domination, social awareness

	TL	SA	SC	SD	SA
Transformational leadership T	1				
Self-awareness SA	0,38	1			
Self-confidence SC	0,48	0,436	1		
Self-domination SD	0,50	0,336	0,312	1	
Social awareness SA	0,51	0,209	0,208	0,207	1

The results show that the ability to practice transformational leadership seeks manager which has certain socio-emotional competencies, such as: self-awareness, optimism and openness, optimal self-confidence, to enjoy in other people's company, ability to accept new ideas and to approach people with confidence.

The results from the poll questionnaire showed high level of awareness in managers in terms of meaning of social competencies and present the need to develop those competencies in the leadership and the other employees. These conclusions came after concrete observation and answers analyses of the poll made for this research and also from the interview.

On the question do they know what is emotional and social competence, 74% answered that they know; 20% that they have heard, but they do not know, while the rest 6% have not heard at all about this concept. On the question if there is a need for self-grow of the emotional and social competencies, 85% answered yes, 15% said maybe and 10% said no. On the question, would they take part in education for developing social and emotional competencies, 95% from the managers said yes, 4% answered maybe and 1% said no.

According to the reports from the interview, the managers with high level of self-awareness and understanding (emotional awareness and empathy) can influence forming positive organizational culture based on positive motivation. On the other hand, managers with low level of emotional competence have not got the power to create positive motivation. That directly affects the work success.

From the questions above, conclusions were made and they will be interpreted in the following paragraphs.

Conclusion

According to the findings and results, it can be stated that social and emotional competence of leaders represents capital for effective leadership, and also a way to get rival advantage. Word trends show that the use of effective leadership becomes more implemented in the process of getting rival advantage. This means bigger systematic and planned investment in development in managers on all levels, meaning development of their social and emotional competencies.

What comes out of this research? The result of this study has enabled evolving a Model of emotional intelligence with incorporating key competencies for leadership in organizations of managers and leaders on all levels. It is necessary to create trainings for management and leadership teams in the organizations, which are headed to developing the emotional intelligence and improving emotional competencies for responsibility leadership of their positions. Training programs could be conducted to build appropriate skills essential for success leadership.

Educators are responsible of to convert theories and research into practical applications in the training courses. Business educators have the responsibility to provide their students in colleges and higher level institutions with a strong foundation in both technical and emotional training so that they will be well-rounded individuals, and hence dynamic leaders, effective managers and worthy employees.

IMPROVING ORGANIZATIONAL COMMUNICATION AS A STRATEGIC PERSPECTIVE FOR RELEVANT RESULTS IN ORGANIZATIONS

Abstract

One can freely say that organizational communication has its own driving force that leads the organization towards achieving the organizational goals. The organizations that are in a position to recognize strategic importance in organizational communication have the inherent privilege to be the leaders within the frames of the successful organizations and to keep their competitive advantage in the long run.

This paper gives a theoretical review of the importance of organizational communication for the development of organizations, and is also highlighted by the numerous research results that provide this confirmation. In this way, the paper emphasizes the importance of organizational communication and confirms its strategic value in direction of achieving high organizational results.

Key words: *organizational communication, strategy, development.*

Introduction

In the theory that studies communication as a term, various interpretations and definitions of this term can be found. The simplest definition is in the direction of accepting that communication is a concept for the exchange of information between entities (<http://en.wiktionary.org/wiki/communication>).

The theory of communication most often defines its four levels as: intrapersonal, interpersonal, organizational, and mass. Each of these levels takes a different position in the everyday interactions of people, starting from different situations. (Hargie et al., 1999).

As a basis of all other communications, intrapersonal communication is of the person to him/herself. The mental abilities and activities of one person primarily have the biggest impact on this communication. It foremost refers to the movement of thought as a result of mental processes in a person i.e. how an individual processes, stores and produces messages including elements of perception, emotion, attitudes, self-awareness and cognition. On the other hand, the focus of the interpersonal is on the relationship between two individuals or a small group of people. The communication abilities and skills and communication

¹ Assoc. Prof. Ph.D, BAS Institute of management Bitola, mitrevski_viktor@yahoo.com

² BAS Institute of management Bitola/Business Academy Smilevski BAS - Skopje

³ PhD, Business Academy Smilevski BAS – Skopje, gvasilevski@yahoo.com

dysfunction is analyzed in the process. This communication is the most widespread and most frequent, in conditions of physical proximity to individuals, using all senses.

Organizational communication is the next level of communication, as a complex and continuous process and whose impact is significant for growth and development of a separate organization. The focus of this communication is placed on group norms, their development and implementation. Finally, there are mass communications that occupy a significant place in each person's life. The means used in this kind of communication are increasingly considered to have become a benefit to the broad masses of people, who in turn accept and use them widely. Their main characteristic is the ability to become close to and with each person, often to impose aggressively, can serve as a means of manipulating people, yet they have a developed strategy of their own presentation that is based on a popularity of those who offer an efficient way to make the offer close and accessible to everyone (<https://tufekciev.wordpress.com>)

Communication, in its complex form, contains three main components: "Social, emotional and informative" (Report on the Communication Strategy in the Environment, according to Component 2). The social component establishes and maintains the relationships among those who communicate. The emotional transmits the emotions of the communicating parties, and the informative component transmits individual information.

Table1: Three dimensions of communication

Dimension	Description	The consequence
Social	What is our relationship?	Motivation
Emotional	How do I feel?	
Informative	What does he/she say?	Change

Source: Technical Report on the Communication Strategy in the Environment,
According to Component 2, p. 59

1. Organizational Communication

Besides studying the method and norms used for communicating by groups and teams in a particular organization, organizational communication places a lot more emphasis on creating special organizational identity, which can be an important strategic advantage and value that will provide the organization with a competitive advantage in the long run. Creating a special organizational identity is part of the strategic steps for creating a unique organizational culture, interpreted through symbols and values that give an exterior visible expression and a special perception of them by potential customers.

Organizational communication is much more complicated and more complex than the daily communication between individuals. Successful external and internal communication is an important precondition for the development of a modern organization, the achievement of organizational goals and interaction in turbulent and changing environments. In order to ensure high success, the organization should allow for a timely flow of information and their exchange through a series of efficient mechanisms. Only in this case each employee can properly represent the organization beyond its borders, because he/she will know what to represent, understand the mission and the vision, and feel affiliation to the organization. It is therefore considered that in the absence of good internal communication, the external will require much more effort and energy.

However, researchers of organizational communication believe that it should be divided into internal and external, because each has its own distinct features, but preference should not be given only to one of them. Namely, the organizations communicate internally, that is, in their organizational units and among the employees, but at the same time they communicate externally. Nevertheless, in both cases they use different communication strategies.

The initial, and, of course, the later impression that the organization leaves in the external environment, with its external communication, has a high impact on the success of the organization. Given that we live in a time of constant interaction and communication, creating a positive public image is of great importance to the organization. Given this importance, it is of utmost importance that the organization develops a strategy and a set of skills and abilities that should be developed by members of the organization, who are active stakeholders in external communication.

The strategic value of organizational communication is also reflected in the fact that it is essential in the process of organizational change. In fact, good strategic leaders of organizations know that communication is not just talking and transmitting information, but one should also be a good active listener. The employees in the organization are the main carriers of the work process and are an excellent resource for getting information, proposals and suggestions. These are valuable components that have double gain, on the one hand, for the strategic leaders in the process of making strategic decisions or managing organizational changes, and on the other hand positively affecting employees, creating a sense of belonging and importance to the organization. Because of this dual benefit, successful organizations have communication in all directions, both top-down and bottom-up.

In this way, strategic leaders in the organization build trust among their employees by creating a favorable climate for major organizational outcomes or in the process of leading a series of organizational changes. In this case, the democratic and liberal style of leadership are characteristic and create an atmosphere where employees are involved in giving opinions and suggestions and where freedom of discussion is a regular phenomenon. This way of communication can be applied in every organization regardless of its activity and size.

Although there are still many organizations using the Top-down communication strategy, it is thought to be effective, but not incredibly fast, and can fall apart

within the lower organizational layers of the organizational hierarchy, which can create a large number of additional communication and cultural problems (Colwell, 2015).

According to the Institute of Communication Studies, the effective communication acts as a bloodstream of the organization and maintains a healthy balance in its environment and is important for (www.merc.org.mk):

- implementing the goals of the organization ;
- developing a plan for its achievement ;
- organizing the team and resources in the most successful way ;
- leading, motivating and creating a climate where it is communicated best with the target groups ;
- control of the overall activities of the organization .

The study "Linking Organizational Characteristics to Employee Attitudes and Behavior" (Oakley, 2005) sets out some conclusions, which also relate to the connection of organizational communication with the development of organizations. As a main conclusion stands identifying the communication as a single key organizational feature for raising employee satisfaction and employee satisfaction is a key precursor to increased engagement and commitment of employees. The fact is that the commitment of the employees is directly linked to increased organizational efficiency and effectiveness, increased number of clients, and thus increased profitability. In this study, organizational communication is evaluated according to the effectiveness of the movement of information up and down the organizational hierarchy. The study bases the conclusions on the findings of a research conducted on 5,568 employees in 90 organizations in the American media industry and 37,036 users.

A similar study (Geiger, 1975) shows that positive communication leads to employee satisfaction and vice versa, negative communication leads to dissatisfaction. Apart from being associated with employee satisfaction, communication also appears as a predictor of cohesion and productivity in an organization. At the same time, it emphasizes that the organizational communication is very important on a daily basis. It is considered a unique tool which allows managers and employees to determine the level of progress of fulfillment of the organizational objectives and determining the need for corrective actions. By mutual communication, both horizontal and vertical, respect for employees is expressed, their role in the success of the company is defined, guidelines for future actions are provided and trust and confidence in the organization is fostered.

In organizations that have a significant application of IT technology, a networked environment is created that encourages employees to participate in the process of gathering or sharing information and resolving organizational issues, mainly through collaboration. This mode of operation also reduces the hierarchical, traditional, management barriers and even the boundaries of the organization. However, with this kind of communication, most of the information is transmitted through the terminals, so personal contact between people disappears. As a by-product, this can lead to a reduction in the amount of informal

information, and this can reduce the effectiveness of the decision-making process (Curtis , Cobham, 2005).

Managing with the way of informing and communicating in the organization implies certain behavior of the collaborators, that is, the subordinates. According to some surveys, the number of associates is growing (it is estimated up to 50%) who, due to lack of information and poorly organized organizational communication, are closed in, they are released from their work obligations and only act as extras on the job. It is very important to develop good communication relations between superiors and colleagues, because experience has shown that, in essence, this is what most motivates the employees. Many managers do not know this and do not want to know it, so they make some typical mistakes that result in employee frustration and discontent. Basically, what managers are required in communicating with subordinates is the exemplary attitude towards them in order to avoid the stressful situations that both sides can bring.

2. Organizational Communication and Organizational Changes

The influence of organizational communication is also essential in the process of implementation of organizational changes. Organizations most often use two models of change: the Kurt Lewin model and John P. Kotter's eight-step model.

In the Lewin model, which involves three stages-defrosting, changing and stabilizing-the transition from one stage to another requires a high level of communication between managers and employees. It is a fact that in every organizational change, there is resistance from employees to the implementation of the change, primarily because of the uncertainty and distrust that is born in this process. That is why communication is a tool that change managers need to use for easier transition from one phase to another and overcoming the misunderstandings that appear. Also, when applying the model of Kotter, communication strategies are applied. It is usually communicated in relation to important strategic determinations of the organization, such as the vision, mission and goals of the organization.

Husain (2013) also identifies that the role of communication during business organizations is essential for successful change management. In order to encourage employees to achieve the desired changes, they need to cope primarily with their concerns and solve any problems that arise on that path. This is essential, because employees are the key source to accomplish changes in the organization. The level of work insecurity needs to be reduced and a sense of belonging to the organization be created, so that employees can feel their responsibilities on that path of change. Employees are most motivated to pave the way for organizational change, only when they have the opportunity to participate in the planning of the change.

The study of Adegbuyi and colleagues (Adegbuyi et al., 2015), through a review of various literature, finds that business strategies with client orientation, employee autonomy, communication, training and job development are the main role in organizational performance development, social responsibility and motivation factors. This study suggests that recognizing the reasons for the level of organizational performance is important especially in the perspective of current

global crises, since it helps organizations identify those factors that need to be given priority attention, in order to improve organizational performance.

In this context, a number of authors pay attention to the correlation of effective communication and performance of the organization. Such a correlation is presented in the table below.

Table 2: *Relation between the effective organizational communication and organizational performance*

		Perceived organizational performance
Effective business communication	Pearson correlation	.456
	Sig (2-tacted)	.0000
	N	484

Source: Field survey, 2010

Table 1 shows a significant correlation between effective organizational communication and performance in the organization ($r = 0.456$, $p < .01$). These results are similar to the findings of the existing literature, which indicated that there is a significant positive link between effective business communication and the performance of the organization (Blalock, 2005, Alyssa, 2006), which directs us towards the statement of the impact of organizational communication on the development of a separate organization, and hence, on its competitiveness in the environment.

Research also shows that managers spend up to 30% of working hours in solving organizational conflicts and finding solutions to them (Saha, 2006). It points to the conclusion that it is important that the leaders in the organizations know the reasons, but also the mechanisms and ways of resolving conflicts in the organization. Organizational conflicts are an integral part of daily work, but this does not have to mean that they are necessarily negative and destructive. Often they can become an opportunity and provide answers to many problems and possible solutions. Any change in the organization undermines its former balance and creates preconditions for open or hidden conflicts.

Conclusion

Today, communication takes a central place in the functioning of organizations and its importance is raised to the extent that it is also related to the development and profit, that is, the overall survival of the organization. It is because of the importance of organizational communication that it becomes one of the most researched areas in the academic circles.

The literature review and analysis of the research so far shows the unbreakable relationship between organizational communication and organizational development. What is underlined as a recommendation is that managers should

avoid a top-down communication that is limited to giving organizational tasks, and much less to listening to ideas and suggestions from employees.

In successful organizations, the communication takes place in all directions. However, even though the organizational communication involves managers at all hierarchical levels and employees, it is still considered that the managers should be considered effective carriers of organizational communication. They should represent an appropriate example that employees will follow and practice. Namely, the communication in a separate organization should have a continuous character, be developed and continually improved.

Research carried out in Macedonian organizations confirms that there is a greater or lesser dependence on the effectiveness of communication with the performance of the work activities, that is, the achievement of the business results. At the same time, the communication in direction manager-employee has a greater influence on the performance of the tasks than the communication in direction employee-employee. This means that when employees talk and evaluate the communication in the organization in which they work, they primarily think about communication with their managers (Vlashcheva, 2011).

On the other hand, this research confirms that the greatest intensity of connectivity exists between communication skills and relationships and job satisfaction as one of the factors that influence the better and more effective fulfillment of goals. Knowing that only satisfied employees do their job well and have a greater motive for achieving and advancing, the managing structures in organizations must pay great attention to this aspect of the functioning of organizations.

It is because of the great importance of organizational communication and its impact on organizational development that it should have a treatment of strategic priority in the organization and be constantly developed and improved according to the needs of the environment.
